

Bullying & Student Safety

Detailed Dashboard Analysis Report — A multi-dimensional view of student safety and bullying-related reporting across U.S. schools, covering students, victims, disciplinary actions, allegations, and schools at the state level.

U.S. NATIONAL SCOPE

STATE-LEVEL ANALYSIS

5 DASHBOARD DIMENSIONS

Made with **Gamma**

Key Figures at a Glance

The dashboard presents a multi-dimensional view of student safety across U.S. schools. California repeatedly appears among the leading states across several measures. New York is the highest-victim state; Illinois is the highest-allegation state. Sex is the largest protected-basis allegation at 55.6K, indicating highly uneven composition across categories. These findings are descriptive, not causal.

168K

Total Students

Overall student count on the main dashboard

91K

Total Disciplined

Students associated with disciplinary action

77K

Total Victims

Victim count on the main dashboard

96K

Total Schools

Schools represented in the dashboard

135K

Total Allegations

Overall allegation count across all schools

33K

IDEA Students

12K

ELL Students

English Language Learners shown

Student, Victim & Discipline Overview

Headline Ratios

Disciplined students represent roughly **54%** of the displayed student total (91K/168K), while victims represent roughly **46%** (77K/168K). These are descriptive ratios based on dashboard totals — not probabilities of being disciplined or victimized.

Category Distribution

Students by Category: **Sex** leads at ~56%, Race at ~32%, and Disability at ~12%. The three categories are not evenly distributed.

Top 10 States by Students

California leads at ~29K students. The gap between disciplined and victim counts varies substantially by state — these measures should not be treated as interchangeable.

Geographic & Race-Based Analysis

Highest Victim State

New York — explicitly identified as the top victim state by raw count

Highest Disciplined State

California — highest disciplined state; also top IDEA and ELL state

Lowest Disciplined State

Alaska — lowest disciplined state by raw count

Lowest Victim State

Florida — lowest victim state by raw count

 These rankings reflect absolute dashboard counts. A state with a smaller student population can have a lower raw count even if its rate per student is higher. Rate-based comparisons require population denominators not provided in the screenshots.

Total Students by Race: Victims vs. Disciplined

■ Total Victims (K)

■ Total Disciplined (K)

White students have the largest displayed total at ~134K (46K victims + 88K disciplined). Black students follow at ~73K, Hispanic at ~57K. Remaining categories are materially smaller: MultiRace (~13K), Asian (~10K), AIAN (~6K), NHPI (~2K). Because these are raw counts, the chart describes scale and composition – it does not establish disproportionate risk. Comparisons across groups should ideally be normalized by group size before making statements about relative prevalence.

IDEA & ELL Student Analysis

IDEA Students — 33K Total

Top State: California (5.2K), followed by New York (3.8K) and Illinois (2.1K).

Gender: 75% Male / 25% Female

Category: Sex 51% · Race 26% · Disability 23%

ELL Students — 12K Total

Top State: California (5.0K), followed by New York (0.9K) and Texas (0.6K).

Gender: 69% Male / 31% Female

Category: Sex 59% · Race 28% · Disability 13%

📌 Notable contrast: Sex is the largest category for both populations, but higher for ELL (59%) than IDEA (51%). Disability is more prominent in IDEA (23%) vs. ELL (13%).

Allegation Landscape: 135K Total Across 96K Schools

Top States by Allegation

Top Schools by Allegation

Illinois leads all states at ~20K allegations. California and New York follow at 18K and 11K. Alaska is the lowest-allegation state. Top schools by allegation are led by California (10K) and Texas (9K).

Allegations by Protected Basis

Protected Basis

Sex is the dominant protected basis at **55.6K allegations** — roughly **41%** of the displayed 135K total. Race follows at ~31K, Sexual Orientation at ~22K, Disability at ~17K, and Religion at 11.2K. The composition of allegations is **highly uneven** across protected-basis categories.

❏ This percentage is approximate. Visible category values are rounded and may be subject to dashboard filtering or distinct-count definitions. Do not treat as exact.

6 Key Patterns Across the Dashboard

California: Recurring High-Volume State

Highest-disciplined state, top IDEA state, top ELL state, and near the top in student counts and allegations.

New York: Prominent for Victims

Explicitly the highest-victim state; also near the top in student counts, IDEA, ELL, and allegations.

Illinois: Leads Allegation Ranking

Highest-allegation state at ~20K; also appears strongly in student and IDEA views.

Sex: Dominant Category Across Views

Largest category in the main student view, the largest protected basis in allegations, and the top category in both IDEA and ELL donuts.

Discipline $\neq$ Victims

The disciplined-versus-victims state comparison shows different gaps by state — these measures capture different aspects and should not be collapsed.

Raw Counts Need Population Context

The largest race and state groups also have the largest raw counts. Without denominators, the dashboard cannot establish whether a group has a higher underlying rate.

Data Interpretation & Recommended Next Steps

Key Limitations

- **Metric ambiguity:** Terms like "students," "victims," and "disciplined" are not fully defined (row counts? distinct entities? incidents?)
- **Filter ambiguity:** Screenshots don't confirm filter states — totals across pages may not reconcile
- **Rounding:** Values in K units are rounded; derived percentages are approximate
- **No causal inference:** Dashboard shows distributions and rankings, not causation
- **No rate-based conclusions:** Raw counts favor larger populations; rate comparisons need denominators
- **Potential overlap:** Categories may not be mutually exclusive

Questions for Deeper Analysis

- What are victim, discipline, and allegation rates per 1,000 students by state?
- How do allegation rates differ after adjusting for the number of schools per state?
- Are victim-to-discipline gaps meaningful after normalization?
- How do race-specific rates compare after adjusting for group size?
- Are IDEA and ELL students disproportionately represented in allegations?
- What reporting periods are represented, and do patterns change over time?

📌 **Recommended next step:** Pair the dashboard with a data dictionary and the underlying dataset. The most valuable enhancement would be a rate-based analytical layer, followed by time trends and statistically appropriate comparisons.
